                                                                        available on the World Wide Web.

(URL, http://www.sanger.ac.uk/Projects/M_tuberculosis/) CDS have been renumbered from the original cosmid submissions but the old gene designations are in brackets after the new gene numbers. Gene prediction was based on a Hidden Markov Model of TB genes implemented in TBparse (Krogh) supplemented with visual inspection of positional base preference in codons, especially where there is an increase in the observed/expected third position G + C.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cole, S.T., Brosch, R., Parkhill, J., Garnier, T., Churcher, C., Harris, D., Gordon, S.V., Eiglmeier, K., Gas, S., Barry III, C.E., Tekaia, F., Badcock, K., Basham, D., Chillingworth, T., Connor, R., Davies, R., Devlin, K., Feltwell, T., Gentles, S., Connor, R., Davies, R., Devlin, K., Feltwell, T., Gentles, S., Hamlin, N., Holroyd, S., Hornsby, T., Jagels, K., Krogh, A., McLean, J., Moule, S., Murphy, L., Oliver, S., Osborne, J., Quail, M.A., Rajandream, M.A., Rogers, J., Rutter, S., Seeger, K., Skelton, S., Squares, S., Sqares, R., Sulston, J.E., Taylor, K., Whitehead, S. and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This DNA sequence codes for thermostable esterase VF5-23LC (W23074) of Aquifex VF5, a marine strictly chemolithoautotrophic (W23074) of Aquifex VF5, a marine strictly chemolithoautotrophic (Knall gas bacterium that grows optimally at 85 deg C and pH 6.8. It can be amplified from a pBluescript vector by PCR (see T79312-13). Claimed, newly identified polynucleotides (T79321-30) encoding esterases (W23069-77, W23088) were recovered from genomic libraries. They can be used for recombinant production of the enzymes in host cells, and as probes to identify related sequences. The esterases aperior for use in production of pure chiral compounds used in pharmaceutical, agricultural and other chemical industries. A method is claimed for transferring an amino group from an amino acid to an alpha-keto acid using a claimed esterase. The enzymes may also be useful as ripening starters in cheese making, in lignin removal in paper and pulp manufacture, in carbohydrate derivative synthesis, in fermentable sugar production from lignocellulosic waste, in the study of plant wall structure, plant resistance to disease and organic matter decomposition and to select plants bred

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
of Aquifex pyrophilus, a Gram-negative, chemolithoautotrophic knall gas marine bacterium which grows optimally at 85 deg C and pH 6.8. It can be amplified from a pBluescript vector by PCR (see T79306-07). Claimed, newly identified polynucleotides (T79321-30) encoding esterases (W23069-77, W23088) were recovered from genomic gene libraries. They can be used for recombinant production of the enzymes in host cells, and as probes to identify related sequences. The esterases are stable at high temperature and in organic solvents, making them superior for use in production of pure chiral compounds used in pharmaceutical, agricultural and other chemical industries. A method is claimed for transferring an amino group from an amino acid to an alpha-keto acid using a claimed esterase making
                                                                                                                                                                                                                                      Nucleic acid encoding heat stable esterase from thermophilic bacteria - which is active in organic solvents, useful in chapaper manufacture, and to study plant resistance to disease
                                                                                                                                                                                                               Claim 1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DNA encoding Aquifex pyrophilus esterase 28LC.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   16-FEB-1998

New nucleic acid encoding polyketide-like synthesis enzymes Vibrio marinus - and transformed plants and microbes that propyrnsaturated fatty acids, useful as pharmaceuticals and f of.

Example 1; Fig 5; 153pp; English.

generate transgenic plants that can express transgeness encoding PRS-like genes associated with PUFA production. The PRS-like genes are used to transform plants and microbial cells to give recombinants having altered contents of PUFA (specifically DHA and EPA). Oils from these plants are useful as dietary supplements (in infant feeeding formulations, to give a PUFA profile closer to that of human milk; for treating malnutrition; in intravenous feeding formulations; in cooking oils, fats etc.), also as anti-inflammatory agents and for reducing cholesterol levels. Fragments from the genes are useful as probes to isolate related molecules or to detect organisms that express PKS-like genes. The method facilitates synthesis or suppressing interfering pathways. Expression of PUFA in seeds allows simple recovery, as oil which can be engineered to have a particular PUFA profile. Expression in microbes also allows simple recovery and control of PUFA profile and is not subject to external variables such as weather or food supply. The present sequence represents an approximately 40 kb PKS-like cluster DNA fragment from v. marinus comprising open reading frames (ORFs) 6, 7, 8 and 9. production of docosahexanoic acid (DHA) in Vibrio marinus are used to The invention provides polyketide-like synthesis (PKS)-like genes that are used for the production of long chain poly-unsaturated fatty acid (PUFA) productions. Genes responsible for eicosapentenoic acid (EPA) production in Shewanella putrefaciens and novel genes associated with the

genes. They are also useful for creating transgenic plants that express poly-unsaturated long chain fatty acids. The poly-unsaturated long chain fatty acids of the poly-unsaturated long chain fatty acids produced recombinantly are useful as dietary supplements for patients undergoing intravenous feeding or for preventing or treating malnutrition. The poly-unsaturated long chain fatty acids can also be incorporated into cooking oils, fats or margarine formulated so that in normal use the recipient receives a desired amount of poly-unsaturated long chain fatty acids. The nucleic acids are also useful in large scale production of docosahexenoic acid and elicosapentenoic acid, and for the modification of the fatty acid profile of host cells and edible plant tissues and/or plant parts. Transgenic production of polyunsaturated fatty acids in particular host cells allows quicker purification from natural sources such as fish or plants. This sequence represents a vibrio marinus DNA fragment encoding the PKS gene cluster incorporating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes novel DNA sequences encoding for polyketide (PK)-like synthesis (PKS-like) pathway genes from Shewanella, Vibrio and Schizochtrium. The nucleic acids are useful for isolatting related molecules or in methods to detect organisms expressing the PKS-like
                                                           ORF6 to ORF9.

The antigenic proteins, their fragments, their nucleic acids and antibodies are used for diagnosis, prevention (as vaccines) or treatment of Neisseria infections, such as meningitis, septicaemia and gonorrhea. Both organisms are closely related. Fragments of the nucleic acids are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 18-NOV-1997;

                                                                                                     prevention (as vaccines) or treatment of Neisseria infections, such as meningitis, septicaemia and gonorrhea. Both organisms are closely related. Fragments of the nucleic acids are useful as hybridisation probes and antisense reagents.
                                                                                                                                              Nucleotide sequences Z11972-Z12358 represent open reading frames (ORFs) of Neisseria meningitidis and N. gonorrhoeae which encode antigenic proteins (see Y38499-Y38944). The antigenic proteins, their fragments, their nucleic acids and antibodies are used for diagnosis,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     polynucleotide ORF sequences, which are all used in the exemplification of the present invention. The nucleic acid sequences, protein sequences, cand antibodies against them, can be used in the manufacture of a composition. The composition can be used as a medicament (or in the manufacture of a medicament) for treating, preventing or diagnosing infection due to Neisserial bacteria. For example, some of the identified proteins could be components of vaccines against Meningococcus B; against consequences from the bacterium will also facilitate production of sequences from the bacterium will also facilitate production of biological probes, particularly organism-specific probes. Attempts to make efficacious Meningococcus B vaccines have failed mainly due to antigen tolerance. Multivalent vaccines have also been tried but none chare successfully overcome antigenic variability. The provision of conserved them, complete sequences may provide an opportunity to identify secreted or surface exposed proteins that may be presumed targets for the immune system and which are not antigenically variable or at least more
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes the full length genome of CC Neisseria meningitidis B (NMB). The sequences in F21544 and F21607 to CC F21613 represent fragments of the NMB genomic sequence, as the sequences cC was too long to go in a record on its own it was split into 8 sequences CC which overlap each other at the beginning and end of each sequence by 4980 bp (i.e. the last 49980 bp of F21544 is repeated at the beginning CC of F21607, the last 49980 bp of F21547 are repeated at the beginning of F21508, and so on). F21545 to F21588 encode the Neisseria proteins given in B5550 to B5593, and F21589 to F21607 are repeated at the beginning CC are used in the exemplification of the present invention. The NMB genome CC and fragments from it have antibacterial activity, and can be used in CC vaccines and gene therapy. Neisseria nucleic acids, proteins and/or antibodies which binds to the proteins can be used in compositions for CC treating or preventing infection due to Neisserial bacteria or as a CC diagnostic reagent for detecting the presence of Neisserial bacteria or conjuter storage medium or computer databases can be used in a search to identify open reading frames (ORFs) or coding sequences within the NMB genome. The DNA sequences provide further opportunities to find antigenic or immunogenic proteins which are more effective in vaccines
                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

The present invention describes methods of obtaining immunogenic C proteins from Neisseria genomic sequences. A81453 to A82414 represent C specifically claimed Neisseria meningitidis genomic DNA sequences; A81260 C to A81303 and B25620 to B25663 represent Neisseria DNA sequences and C their corresponding proteins; A81254 to A81259 and A81304 to A81321 C represent PCR primers used in the isolation of Neisseria meningitidis DNA sequences; and A81322 to A81452 represent Neisseria meningitidis DNA cequences; and A81322 to A81452 represent Neisseria meningitidis DNA sequences, and A81322 to A81452 represent Neisseria meningitidis DNA composition. The composition of the present invention. The nucleic acid sequences, protein sequences, of the present invention can be used in the exemplification of composition. The composition can be used as a medicament (or in the manufacture of a medicament) for treating, preventing or diagnosing infection due to Neisserial bacteria. For example, some of the identified proteins could be components of vaccines against Meningococcus B; against C all serotypes; and/or against all pathogenic Neissariae. Identification of sequences from the bacterium will also facilitate production of biological probes, particularly organism-specific probes. Attempts to make efficacious Meningococcus B vaccines have falled mainly due to antigen tolerance. Multivalent vaccines have also been tried but none can be used as a medicament of the new successfully overcome antigenic variability. The provision of

The antigenic proteins, their fragments, their nucleic acids and antibodies are used for diagnosis, prevention (as vaccines) or treatment of Neisseria infections, such as meningitis, septicaemia and gonorrhea. Both organisms are closely related. Fragments of the nucleic acids are useful
                                                                                                                     Z12212 standard;
